

## CLAIM AMENDMENTS

1. (currently amended) A system for controlling transmission of data packets through an information network, each data packet comprising a content portion, a header, and a trailer, the information network having a plurality of user workstations communicatively coupled to a network access point (NAP), said system comprising:

a Regional Transaction Processor (RTP); and

~~coupled to the RTP~~, a data Enabling Device (DED), said DED being disposed at the NAP and communicatively coupled to the RTP, said DED containing content match information and operable to:

~~receive~~ inspect at least the content portions of data packets from the information network transiting the NAP;

~~detect~~ forward an inspected data packet when information within the content ~~portions~~ portion of a data packet is not substantially similar to content match information; and

when information within the content portion of ~~[[a]]~~ an inspected data packet is substantially similar to content match information, temporarily store the inspected data packet, initiate issuance of a DED message to a recipient user workstation, and invoke the RTP to process a transaction; wherein

the RTP transmits an RTP message to the DED authorizing forwarding of the data packet only when a result of the transaction indicates that forwarding is appropriate.

2. (previously presented) The system as set forth in claim 1, wherein the transaction is based on control information associated with the content match information.

3. (previously presented) The system as set forth in claim 1 wherein the DED is operable to detect when the data packets include content match information at a rate proportional to the rate at which the data packets are received by the DED.

4. (canceled)

5. (previously presented) The system as set forth in claim 1 wherein the RTP comprises a network server and a database, and is operable to process requests for content.

6. (canceled)

7. (currently amended) The system[[,]] as set forth in claim 1, further comprising a plurality of ~~DEDs~~ NAPs along a network route, wherein each NAP has an associated DED [[is]] operable to communicate with at least one of the other DEDs.

8. (currently amended) The system as set forth in claim 7 wherein ~~the plurality of DEDs include~~

a first NAP includes a first DED that generates for generating a message DED message;  
and

the system comprises at least one intermediate DED operable to forward the DED message to the a DED closest, within the information network, to the recipient user workstation along the network route.

9. (currently amended) The system[[,]] as set forth in claim 7, wherein ~~the~~ a plurality of DEDs are operable to communicate with each other to prevent transmitting more than one DED message for the same data packet ~~through~~ within the information network route.

10. (currently amended) The system[[,]] as set forth in claim 1, wherein the RTP transmits one of a Release\_Content message ~~or~~ and a Cease\_Content message to the DED, based on ~~whether a data packet was authorized to be downloaded to the workstation~~ result of the transaction.

11. (original) The system, as set forth in claim 1, wherein the DED includes Field Programmable Gate Arrays (FPGAs).

12. (previously presented) The system as set forth in claim 11 wherein the FPGAs are reprogrammed over the network to perform a content matching function.

13. (previously presented) The system as set forth in claim 11 wherein a portion of the DED is dynamically reprogrammed, and the DED is operable to continue processing data packets during the dynamic reprogramming.

14. (original) The system, as set forth in claim 1, further comprising a Central Storage and Backup System (CSBS) operable to communicate with the RTP, to monitor operation of the RTP, and to store transaction information.

15. (original) The system, as set forth in claim 14, wherein the CSBS is operable to transmit information to reprogram the DED to communicate with another RTP.

16. (original) The system, as set forth in claim 1, further comprising a content matching server operable to store content match information, to communicate with the DED, and to transmit the content match information to the DED.

17. (previously presented) The system as set forth in claim 1 wherein the DED is operable to suspend transmission of data packets through the information network until a user response to a prompt is received.

18. (currently amended) A method for controlling transmission of ~~identifiable content over~~ data packets through an information network, each data packet comprising a content portion, a header, and a trailer, the information network having a plurality of user workstations communicatively coupled to a network access point (NAP), said method comprising:

providing inspecting at least the content portions of data packets transiting the NAP with  
a data Enabling Device (DED), said DED being disposed at the NAP and  
communicatively coupled to a Regional Transaction Processor (RTP) RTP, said  
DED containing content match information ~~for the content to a DED, wherein the~~  
~~DED is located in the information network along a transmission path of a plurality~~  
~~of data packets, each data packet having a header, a content portion, and a trailer;~~  
receiving forwarding an inspected data packets ~~in the DED; and looking for packet when~~  
information within the content portion of the inspected data packet is not  
substantially similar to content match information ~~in content portions of the data~~  
~~packets; and~~

when ~~content match~~ information is ~~detected in a~~ within the content portion of ~~[[a]]~~ an  
inspected data packet is substantially similar to content match information,  
temporarily storing the inspected data packet, issuing a prompt to a recipient user  
workstation, and invoking the RTP to process a transaction.

19. (previously presented) The method as set forth in claim 18, wherein the prompt is based on control information associated with the content match information.

20. (canceled)

21. (currently amended) The method~~[[,]]~~ as set forth in claim 18, further comprising:  
processing a transaction based on a ~~user's~~ response to the prompt received from the recipient user  
workstation.

22. (currently amended) The method~~[[,]]~~ as set forth in claim 18, wherein the  
information network comprises a plurality of DEDs, and the method further comprising  
comprises transmitting a message among ~~[[a]]~~ the plurality of DEDs ~~along the transmission path~~  
to prevent transmitting more than one prompt for the same data packet.

23. (previously presented) The method as set forth in claim 18, further comprising:  
processing a transaction based on a user response to the prompt, and transmitting a  
Release\_Content or Cease\_Content message to the DED based on whether content was  
authorized to be downloaded to the workstation as part of the transaction.

24. (original) The method, as set forth in claim 18, further comprising: reprogramming a portion of the DED to detect different content match information.

25. (previously presented) The method as set forth in claim 18, further comprising suspending transmission of a data packet through the information network until a user response to the prompt is received.

26. (original) A computer program product comprising:  
program instructions to implement the method of claim 18.

27. (original) A data signal comprising:  
program instructions to implement the method of claim 18.

28. - 53. (canceled)

54. (currently amended) The system as set forth in claim 1 wherein the DED is further operable to search data packets for content match information to determine whether transmission of data packets containing particular content should be unconditionally prevented, and when the DED finds such content match information, the DED prevents, without additional processing, ~~further transmission forwarding~~ of data packets containing said particular content, ~~without additional processing~~.

55. (currently amended) The system as set forth in claim 1, wherein a content provider supplies transaction instructions to the RTP for use by the RTP when processing a transaction when the DED finds content match information in a data packet.

56. (currently amended) The system as set forth in claim 55, wherein the instructions include transmitting a transaction prompt to the recipient user workstation informing of a price to pay for content in ~~the packets~~ a data packet, and allowing the user to accept or decline purchase of the content.

57. (currently amended) The system[[,]] as set forth in claim 55, wherein the instructions specify transmitting a prompt to inform a user that content infected with a virus is attempting to be transmitted from or received by the recipient user workstation, and that transmission or reception of the virus is being halted.

58. (currently amended) The system as set forth in claim 55 wherein the instructions include transmitting a prompt to the recipient user workstation to inform that content subject to security control is attempting to be transmitted from or received ~~to~~ by the recipient user workstation, and that transmission or reception of the content is being halted.

59. (currently amended) The system as set forth in claim ~~55~~ 1, wherein the RTP tallies statistics regarding transmission of designated content.
